

STACKABLE COOLER

ABSTRACT

A stackable cooler includes a first container member comprising a bottom and
5 sides enclosing a container space and configured for insulating the container space. The first
container member defines an opening dimensioned for removably and insulatingly receiving
products into the container space. At least one first hook is supportively associated with the
first container member for hooking to a support structure with the container member hanging
therefrom. The first hook and first container member are configured for placing the stackable
10 cooler in a nested association with second and third stackable coolers that are of similar
construction to the stackable cooler and has second and third container members and hooks,
respectively. In the nested association the first container member is nested through a second
opening in the second container space of the second container member and nestingly receives
the third container member through the first opening in the first container space of the first
15 container member.
